3 结语

研究了橡胶材料剪切模式进行动态应变测

试的方法,并以3种胶料为例进行了测试分析,表明温度是橡胶材料性能的关键因子;通过相同材料多次测试,说明测试过程中会出现Payne效应和Mullins效应,可通过测试多次的方法消除Mullins效应的影响;根据剪切模式受力方式推导了几种超弹性本构模型公式,并与单轴拉伸数据拟合结果进行了对比。

Abstract: In this paper, strain sweep test of rubber compound by using dynamic shearing was discussed, and the test result indicated that temperature was a key factor influencing the rubber material properties. The results of several tests of the same material showed Payne effect and Mullins effect. The influence of Mullins effect could be eliminated by multiple testing. Several hyperelastic constitutive model equations were derived based on shear force mode, and compared with the modeling results from uniaxial tension data.
