Abstract: The thermal conductivities of vulcanizates made from four types of rubber[natural rubber (NR), solution styrene butadiene rubber (SSBR), emulsion styrene butadiene rubber (ESBR) and butadiene rubber (BR)] and nine types of carbon black were studied, and an accurate method for measuring the specific heat capacity of vulcanizate was established to identify the rubber and carbon black types with superior thermal conductivity. The results showed that the modulated differential scanning calorimetry (MDSC) method could accurately reflect the specific heat capacity of vulcanizate and improve testing efficiency and accuracy. The specific heat capacity of vulcanizates with different types of rubber and carbon black increased with the increasing temperature, the thermal diffusivity exhibited a linear negative correlation with temperature, and the thermal conductivity of vulcanizates decreased with increasing temperature. At the same temperature, the thermal diffusivity and thermal conductivity of BR, ESBR, SSBR, and NR vulcanizates decreased in sequence. Carbon black with a high structure and small particle size facilitated the increase of thermal diffusivity of vulcanizate, while carbon black with a moderate particle size had a better effect on improving the thermal conductivity of vulcanizates.

Key words: rubber; carbon black; vulcanizate; thermal conductivity; MDSC method; specific heat capacity

贵州轮胎计划在越南建设年产600万条半钢子午线轮胎智能制造项目

日前,贵州轮胎股份有限公司(简称贵州轮胎)发布公告,根据公司战略发展目标,为提升公司国际化发展新动能,实现国际化、智能化、绿色化发展新跨越的经营指导思想,结合公司在越南的一期年产120万条全钢子午线轮胎项目和二期年产95万条高性能全钢子午线轮胎项目的实施情况以及国内外市场的实际需求,贵州轮胎境外全资二级子公司前进轮胎(越南)有限责任公司拟投资建设年产600万条半钢子午线轮胎智能制造项目。该项目总投资2.28亿美元(约16.41亿元),建

设周期约12个月,第2和第3年投产率分别为60%和80%,第4年达到设计生产能力。

贵州轮胎表示,越南生产基地建设属于公司“双基地”战略发展的重要组成部分,有助于持续提升公司产品、成本和服务三大竞争力,推动公司尽快实现转型升级和国际化、智能化、绿色化高质量发展。目前,除二期项目中的年产5万条农业子午线轮胎项目在进行产品测试外,其他均处于满产满销状态。本项目投产后,将提升越南厂区生产能力,降低生产成本,进一步拓展产品的市场空间和盈利能力,提升公司的全球综合竞争力。
